Feedback on group 1's SORA

Negative points:

Maybe information that you could add to have a more complete SORA :
- Something about the crew of the flight (invent one so that you can talk about the permit…)
- The maintenance of the drone/ plan of maintenance
- A detailed description of the plan of the flight (like where does the drone begin, should it go straight to the coast, at what point the crew will stop having the drone in sight…)
- You could also add some time information like the duration of the flight

Another point that confused us is the fact that in step 3 you say that there is no emergency plan in place but in step 9 you are talking about some plan in case of failure. It feels strange because it feels a bit like it could be considered as an emergency plan?

Positive points:

Even though we put negative points, this SORA seems globally really good. We liked the fact that it is very synthetic and concise. There are some specific points that we found interesting. For example, we didn't think about putting a picture of the location (the map screenshot) but it is really helping us to read and to understand this document.
There is also a nice bibliography, with all the sources.
Another point is the description of altitude which is really nice and it has a good analysis of permission and restriction of flight.
